Similarly, emissive materials applied to non-static, or dynamic geometry such as characters will not contribute to scene lighting. However, materials with an emission above zero will still appear to glow brightly on-screen even if they are not contributing to scene lighting.

Emissive Lighting. Emissive Lighting or in UE4, Emissive Materials, give artists a very cheap and effective way to give the illusion that a Material is casting light when it really is not.

### **Best Practices for Emissive Materials in SketchUp**

Emissive materials are self-illuminated materials, that is, materials that emit light across their surface. When an emissive material is used in a scene, it is rendered as a visible light source, and depending on the intensity you set, its glow can actually light up the surrounding area.

### **Unity Manual Emission**

Right: The emissive material using the emission map. The material has both emissive and non-emissive areas. The material has both emissive and non-emissive areas. In this image, there are areas of high and low levels of light, and shadows falling across the emissive areas which gives a full representation of how emissive materials look under varying light conditions.
