Introduction. Epithelial-mesenchymal interactions are a series of programmed, sequential and reciprocal communications between epithelium and mesenchyme resulting in differentiation of one or both the cell populations involved . Epithelial-mesenchymal interactions were the hallmark of odontogenesis.

Epithelial mesenchymal transition Wikipedia

The epithelial mesenchymal transition (EMT) is a process by which epithelial cells lose their cell polarity and cell-cell adhesion, and gain migratory and invasive properties to become mesenchymal stem cells; these are multipotent stromal cells that can differentiate into a variety of cell types.

Developmental Mechanism Epithelial Mesenchymal

Epithelial cells (organised cellular layer) and mesenchymal cells (disorganised cellular layers) or embryonic connective tissue interact together signaling back and forth by secreted signals or contact in the differentiation of many different organs, tissues and structures. Mechanism - "a process, technique, or system for achieving a result".
