PREFACE The classic statement of the Riemann boundary problem consists in finding a function (z) which is analytic and bounded in two domains D_+ and D_- , with a common boundary L - a smooth closed contour L admitting a continuous extension onto L both from D_+ and D_- and satisfying on L the boundary condition $+(t) = G(t)-(t) + g(t)$.

Abstract. We study the Riemann boundary problem with infinite index of logarithmic order on an open rectifiable Jordan spiral-form contour, here the influence of the contour on the solvability of the problem is comparable with the influence of the argument of its coefficient.

Abstract. A piecewise-continuous Riemann boundary problem with index plus-infinity on a closed rectifiable Jordan curve is studied; here the index of the problem takes into account the integral influence on its solvability of the argument and modulus of the coefficient of the problem and also the properties of the line of conjugation.
