A majority of signal transduction in bacteria is mediated by phosphotransfer signaling systems, commonly referred to as two-component signal transduction pathways. These systems involve two conserved protein components. The first component is a histidine protein kinase that autophosphorylates at a histidine residue, creating a high-energy phosphoryl group that is poised for transfer to

Signal transduction Wikipedia

Signal transduction is the process by which a chemical or physical signal is transmitted through a cell as a series of molecular events, most commonly protein phosphorylation catalyzed by protein kinases, which ultimately results in a cellular response.

What are two component regulatory systems MBInfo

Two-component regulatory systems (TCRS) are important mediators of signal transduction that enable bacteria to detect physical and/or chemical changes and then relay this signal through the cytoplasm to the bacterial nucleoid, where modulation of gene expression occurs.
