X-ray emission from active galactic nuclei have given astronomers many clues about what is going on in these galaxies. Early X-ray observations of AGN showed fairly simple sources that could change brightness over fairly short timescales. Such variability pointed to emission coming from a fairly small area.

The shortest variability timescales seen for active galaxies are on the order of hours, suggesting that the nuclei of these galaxies are smaller than a few light-hours. One light-hour corresponds to 7.2 AU.
